Department of Electronics and Communication Engineering

UEC639 – Digital Communication

B. E. (Third Year): Semester-VI (ENC)

*Tutorial-10*

Q1	Evaluate the probability of bit error performance of following system in the presence of additive white Gaussian channel in terms of energy per bit ( $E_b$ ) to noise power spectral density ( $N_0$ ): (a) Binary Phase Shift Keying (b) Binary Frequency Shift Keying (c) Quadrature phase shift keying
Q2	With the help of a suitable block diagram and the concept of orthonormal basis functions, explain the generation of the 16-PSK signal including its constellation diagram. Also, explain the receiver block diagram of the 16-PSK to estimate the transmitted message. Compare its bandwidth efficiency and bit error performance with BPSK, QPSK, and 32-PSK.
Q3	What is the relationship between bandwidth of BPSK and bandwidth of M-ary PSK system. Write the both bandwidths in terms of data rate $R_b$ also.
Q4	An 8-PSK system is used to transmit a certain $R_b$ data rate through a channel having bandwidth B. If it is desired to transmit $2R_b$ data rate through same channel by using M-ary PSK, what will be the value of M?
Q5	For a (7,4) linear block code, the generator matrix is given by $G = [1\ 1\ 0\ 1\ 0\ 0\ 0; 0\ 1\ 1\ 0\ 1\ 0\ 0; 1\ 1\ 1\ 0\ 0\ 1\ 0; 1\ 0\ 1\ 0\ 0\ 0\ 1]$ . Determine code words of the message – 0011, parity check matrix, and the syndrome for the received vector $r = 0\ 1\ 0\ 0\ 0\ 1\ 1$ .
Q6	Consider a (2,1,3) convolution encoder with $g^{(1)} = (1\ 1\ 0\ 1)$ , $g^{(2)} = (1\ 0\ 1\ 1)$ . a) Draw the encoder block diagram.  Find the code word corresponding to the information sequence (11101) using transform-domain approach.

Complementary Error Function Table
