Department of Electronics and Communication Engineering

UEC639 – Digital Communication

B. E. (Third Year): Semester-VI (ECE)

Tutorial-8

Q1 Derive the impulse response of a matched filter used to maximize the output signal-to-noise (SNR) ratio at the output of receiver circuit.

Solution: Please Refer the Lecture Notes on LMS

Q2 Consider a rectangular RF pulse of duration T and unity energy as

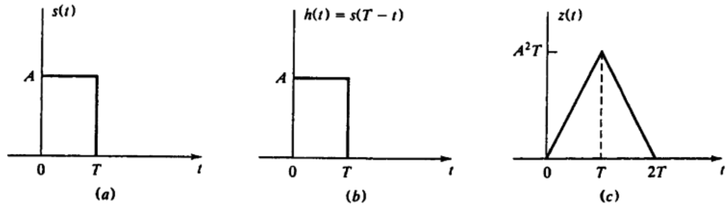
$$\varphi(t) = \begin{cases} \sqrt{\frac{2}{T}} \cos(2\,\pi\, f_c\, t) & 0 \le t \le T \\ 0 & otherwise \end{cases}$$

Where $f_c = n/T$. Determine the impulse response of the matched filter which can process this signal.

Solution: Please Refer the Lecture Notes on LMS

Q3 Determine the output of the matched filter if the input signal is rectangular pulse of unit amplitude and duration T. Also, determine the maximum value of signal to noise ratio at the output of filter.

Solution:



Input Signal   Impulse response of filter   Output of filter (Convolution of input and h(t))

$$z(t) = s(t) * h(t) = \begin{cases} A^2 t & 0 \leqslant t \leqslant T \\ -A^2 t + 2A^2 T & T \leqslant t \leqslant 2T \\ 0 & \text{otherwise} \end{cases}$$

Q4 A bipolar binary signal $si(t)$ is a +1 V or -1 V pulse during the interval (0, T). Additive white noise with power spectral density is $\eta/2 = 10^{-5}\ W/Hz$ is added to the signal in the channel. Determine the maximum bit rate that can be sent with a bit error probability of 10^{-4}.

Prob. of Error = $P_e = \frac{1}{2}\ erfc\left(\sqrt{\frac{E}{\eta}}\right) = \frac{1}{2}\ erfc\left(\sqrt{\frac{A^2\,T}{\eta}}\right) = 10^{-4}$

$$erfc\left(\sqrt{\frac{A^2\,T}{\eta}}\right) = 2 *\ 10^{-4}$$

From Table,

$$erfc(x) = 2 *\ 10^{-4}$$
$$x\ = 2.63$$

	$$x = 2.63 = \sqrt{\frac{A^2\,T}{\eta}}$$ After Solving this we get, $$T = 13.8338 * 10^{-5}; \quad Bit\ Rate = R_b = \frac{1}{T} = 7.2286 * 10^3\ bps$$
Q5	It is required to transmit 2.08 Mbps with an error probability of $0.4 * 10^{-6}$. The channel noise power spectral density is $\eta/2 = 10^{-9}\ W/Hz$. Determine the signal power required at the receiver input. Prob. of Error = $P_e = \frac{1}{2}\ erfc\left(\sqrt{\frac{E}{\eta}}\right) = \frac{1}{2}\ erfc\left(\sqrt{\frac{P\,T}{\eta}}\right) = 0.4 * 10^{-6}$ $$erfc\left(\sqrt{\frac{P\,T}{\eta}}\right) = 0.8 *\ 10^{-6}$$ From Table, $$erfc(x) = 0.8 *\ 10^{-6}\ ;\ x\ = 3.49$$ $x = 3.49 = \sqrt{\frac{A^2\,T}{\eta}}$; After Solving this we get, $P = 50.669 * 10^{-3}$
Q6	In a PSK system, $s_1(t) = A\ cos(\omega c\ t), s_2(t) = -A\ cos(\omega c\ t)$ are coherently detected with a matched filter. The value of A is 12 mV and bit rate is 1 Mbps. Assuming power spectral density of noise as $\eta/2 = 0.5 * 10^{-11}\ W/Hz$, determine the probability of error. Solution $$P_e = \frac{1}{2}\ erfc\left(\sqrt{\frac{A^2\,T}{2\,\eta}}\right) = 7.55 * 10^{-5}$$
Q7	For the input bit sequence **<u>1</u>**0000111, first bit shown in bold and underline is the first generated bit, plot the normalized (amplitude of waveform equals to unity) transmitted wave for the following digital modulation technique • BPSK with carrier frequency $f_c = \frac{1}{T_b}$, where Tb is the bit duration • BFSK having the two orthonormal frequencies given as $f_i = \frac{1+i}{T_b}$, i=1,2 and T_b is the bit duration • QPSK with carrier frequency $f_c = \frac{1}{T_b}$, where Tb is the bit duration
